Title : Use of Microphotography in Optical Manufacture

Orig Pub : Pomiary, automat., kontrola, 1955, 1, No 2, 64-67

Abstract : An article of general character. Brief descriptions of the history and methods of microphotography, an idea is given on the types and technological measures of preparation of scales for ocular micrometers. Characteristics of basic photographic materials used in microphotography are given.

319. APPEARANCE OF COLD AGGLUTININS IN INTERNAL DISEASES -

Występowanie zimnych aglutynin w chorobach wewnętrznych. Bielski J.
3. Klin. Chor. Wewn. A.M., Poznań. POL. TYG. LEK. 1957, 12/8 (286-
290) Tables 3

The level of cold agglutinins was investigated in 13 healthy persons and 43 patients with various internal diseases (9 cases of croupous pneumonia, 14 of rheumatic diseases and 20 cases of other internal diseases). The level in healthy persons ranged from 1:8 to 1:128 and was consistent with the generally accepted norm for Pestalozzi's and Hegglin's methods used by the author. A low titre of cold agglutinins (from 1:8 to 1:128) was found in all examined healthy persons and in a considerable majority of patients (39 out of 43). With the exception of one case of liver cirrhosis no higher titre of cold agglutinins was found than 1:128 in 43 cases of various internal diseases. (VI, 4)

5871. A CASE OF AGRANULOCYTOSIS WITH A RARE FORM OF SKIN CHANGE - Przypadek agranulocytozy z rzadka postacią zmian skórnych - Bielski J. and Moczko S. III, Klin. Chor. Wewn. A. M., Poznań - POL. TYG. LEK. 1958, 13/25 (867-969) Illus. 3

The case described concerns a 71-year-old woman in whom, after the administration of 2 g. of aminopyrine and 8 g. of sulphathiazole, besides typical granulocytopenic symptoms, erythematovesical foci without necrosis appeared on the skin of both legs and buttocks. The patient, whose condition had been grave, rapidly improved after administration of penicillin and vitamins. Parallel with this improvement of the general condition, skin changes healed although no local treatment was applied. The authors think that the skin changes resulted from an allergic reaction in a sensitized person.

1918. Serum protein level as measured by electrophoresis in subjects with fracture of the spine accompanied by cord lesion Elektroforetyczny skład białkowy surowicy krwi chorych ze złamaniem kregosłupa a porażeniami. Bielski T., Oddz. Ortop.-Urazowego Szpital Miejsk. Nr 3, Chorzów Chr. Narząd. Kuchu 1958, 23/2 (167-171) Graphs 3 Tables 2

The following conclusions are drawn: In fractures of the spine associated with cord lesion one observes: (a) a drop of the whole protein and of the albumin level, (b) a definite relative increase of the α_1 , α_2 - and γ -globulin level, the degree of increase depending upon the extent of paralysis and of vascular disturbances, (c) β -globulin fraction rises only slightly. The normal composition of the serum proteins is regarded as a safe guide for initiating rehabilitation at the proper time, with no fears for any harmful effects upon the patient. (IX, 8, 19)

TITLE: Microdetermination of fluorides in urine using mineralization in solution

SOURCE: Chemicke zvesti, no. 4, 1965, 272-280

TOPIC TAGS: microchemical analysis, fluoride, solution property, excretion, biochemistry

ABSTRACT: The mineralization is achieved with 70-72% perchloric acid; 2 volumes of this acid to 1 volume of urine are used. The acid is first heated to 200-205°C and urine added at such a rate that the temperature does not drop below 195°C. The distilling HF is absorbed in NaOH and determined by back titration. The method is faster than concentrating urine and oxidizing the dry residue. In 10 ml of urine a concentration of 1 mg of F per liter may be determined with an accuracy of 4.8%. AUTHOR: Bieńczak, Jan, Engineer
TITLE: Voice frequency telegraph type Tg N24DK
PERIODICAL: Przegląd telekomunikacyjny, no. 7, 1962, 202-206

TEXT: The first voice frequency telegraph equipment built by the Państwowe Zakłady Teletransmisyjne (State Transmission Enterprise) is described in detail. The equipment provides 24 channels in the band of 360 - 3240 c/s can operate on any CCITT telephone circuit, and meets CCITT recommendations for amplitude modulated systems. The 24 channel group can be used on one route or it can be split into 12-channel or 6-channel groups used on different routes. The double-modulation system is employed; there are 4 basic 6-channel groups, 1140 - 1740 c/s; basic groups are shifted to the appropriate part of the total frequency spectrum by using carriers of 2160, 3600 and 4320 c/s, with one group remaining unchanged. The frequency allocation and the general lay-out of the system are described and illustrated by

Card 1/2

Voice frequency telegraph ...

P/022/62/000/007/002/002
D271/D307

block-diagrams. The advantages of the double modulation are discussed. Detailed circuits and full description are given of channel transmitter and receive-circuits; individual oscillators are used in the transmitter. The operational conditions are so chosen that there is no distortion when the level varies slowly in the ± 0.7 neper range. The construction of the equipment is briefly described and a photograph of the rack is given. IF 860 (UF 80) electron tubes are used throughout. A short technical specification is given.

2806. BIENIARZ J. and DABROWSKI Z. Klin. Położnictwa i Chor. Kobiecych Akad. Med., Gdańsk. * Wpływ szczepienia przeciwospowegó na przebieg ciąży. Influence of anti-smallpox vaccination on the course of pregnancy POL. TYG. LEK. 1956, 11/52 (2183-2188) Graphs 1 Tables 4

Anti-smallpox vaccination as a viral infection may cause complications in the mother as well as in the foetus. In the spring of 1953 mass vaccination of the adult population was undertaken. 1,270 pregnant women were vaccinated with the vaccinia virus and 3,515 formed the control group. A harmful effect of anti-smallpox vaccination on the course of pregnancy in its early stages was observed and this was manifested by an almost threefold increase of the frequency of abortions in comparison with the control group. The anti-smallpox vaccination had no injurious effect on the pregnancy above the 16th week. Post-vaccination abortion occurs no sooner than 4 weeks after the vaccination and not later than 12 weeks after it. The pregnancies, however, which began 4 weeks after vaccination, had a normal course. After the vaccination no increase in congenital malformations was seen. (X, 17)

3981. BIENIARZ L and ŚMIGIELSKA A. Klin. Położnictwa i Chorób Kobiecych A. M., Gdańsk. Rola histerografii w rozpoznaniu raka trzonu macicy *The role of hysteroscopy in the diagnosis of cancer of the uterine body* Ginek. pol. 1957, 28/1 (5-9) The characteristic radiological pictures of the localized form and of the diffuse form of cancer of the uterine body are described. These were compared with radiological pictures of other pathological lesions, such as glandular hyperplasia of the mucosa, internal endometriosis, polypi, chronic inflammatory lesions (tb), normal states of the uterine mucosa in the secretory phase and myomas. The authors' material consisted of 8 cases with cancer of the uterine body, 1 with internal endometriosis, 20 with polypi of the uterine mucosa, 6 with chronic inflammatory processes (tb), 11 with myomas of the uterus and 3 with functional bleedings. The authors draw attention to the fact that the localization of the suspicious lesions makes it possible to perform aimed biopsy.
